Contents

- Basics: Arithmetic of LTI systems, Goals of feedback, Loop shaping, Tradeoffs
- Fundamental limitations
 - Bandwidth
 - Waterbed
 - Unstable zeros
 - Magnitude-phase relationship
- Practical control engineering
 - Sampling time
 - Delays
 - Time-frequency relationship

#1

Arithmetic of feedback loops

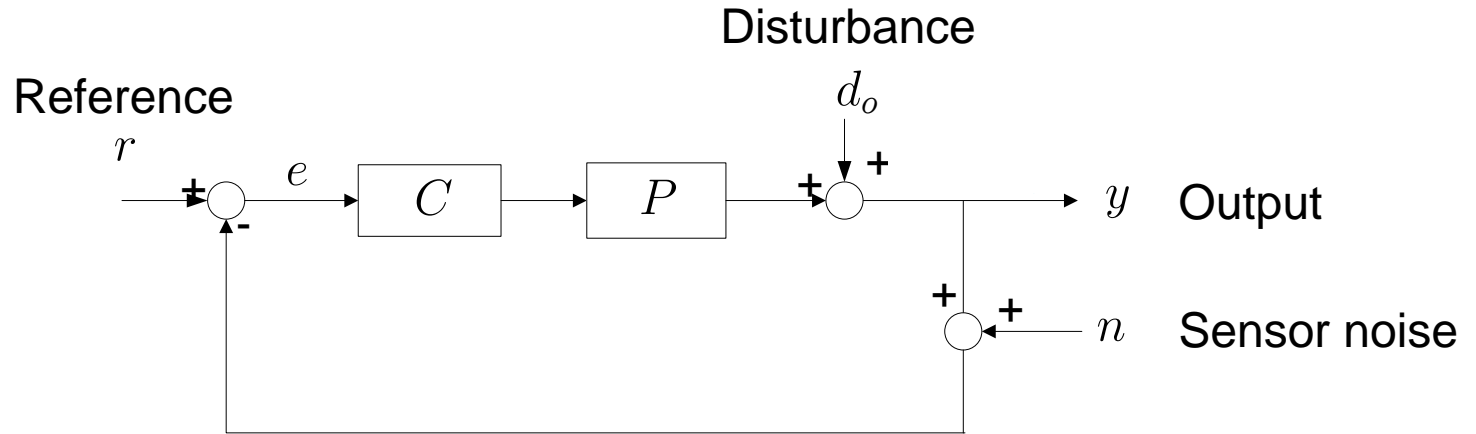

#1

Arithmetic of feedback loops

Arithmetic of feedback loops

$$y = \begin{bmatrix} \frac{PC}{1+PC} & \frac{1}{1+PC} & \frac{-PC}{1+PC} \end{bmatrix} \begin{bmatrix} r \\ d_o \\ n \end{bmatrix} \begin{matrix} \text{Reference} \\ \text{Disturbance} \\ \text{Sensor noise} \end{matrix}$$

Goals of feedback

$$y = \begin{bmatrix} \frac{PC}{1+PC} & \frac{1}{1+PC} & \frac{-PC}{1+PC} \end{bmatrix} \begin{bmatrix} r \\ d_o \\ n \end{bmatrix} \quad \text{Reference}$$

Desired: ~1

Complementary Sensitivity Function

Goals of feedback

Sensitivity Function

$$y = \begin{bmatrix} \frac{PC}{1+PC} & \frac{1}{1+PC} & \frac{-PC}{1+PC} \end{bmatrix} \begin{bmatrix} r \\ d_o \\ n \end{bmatrix} \quad \text{Disturbance}$$

Desired: ~ 1 ~ 0

Complementary Sensitivity Function

Goals of feedback

$$y = \begin{bmatrix} \frac{PC}{1+PC} & \frac{1}{1+PC} & \frac{-PC}{1+PC} \end{bmatrix} \begin{bmatrix} r \\ d_o \\ n \end{bmatrix}$$

Reference
Disturbance
Sensor noise

Desired: ~ 1 ~ 0 ~ 0

Can't do well on both!

Tradeoffs

$$y = \begin{bmatrix} \frac{PC}{1+PC} & \frac{1}{1+PC} & \frac{-PC}{1+PC} \end{bmatrix} \begin{bmatrix} r \\ d_o \\ n \end{bmatrix}$$

Sensitivity Function:

$$S \triangleq (I + PC)^{-1}$$

Complementary Sensitivity Function:

$$T \triangleq PC(I + PC)^{-1}$$

Fundamental Constraint:

$$S + T = I$$

Loop shaping

S defines the tracking and disturbance rejection performances

High-gain feedback

High-gain feedback

small gain in **S**
↔
high gain in **PC**

High-gain feedback

Typical high-gain control for performance at low frequency

Typical low-gain control for robustness at high frequency

Local high-gain feedback

$$S \triangleq (I + PC)^{-1}$$

PC

Frequency response of the sensitivity function

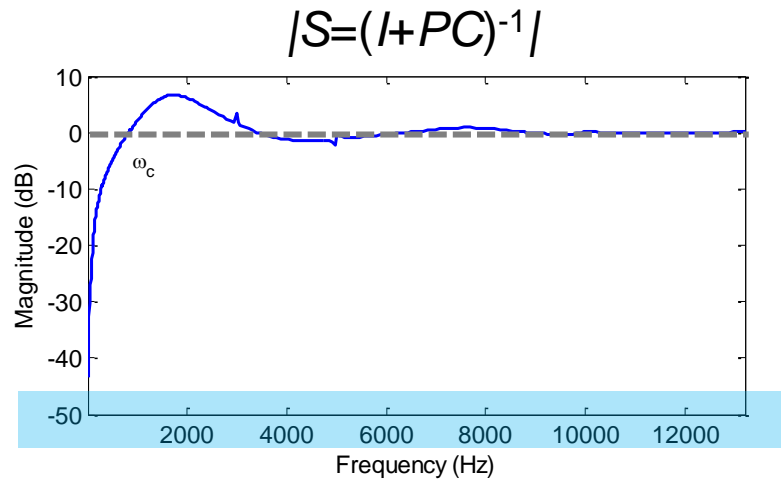

Bode's Integral

Typical feedback design

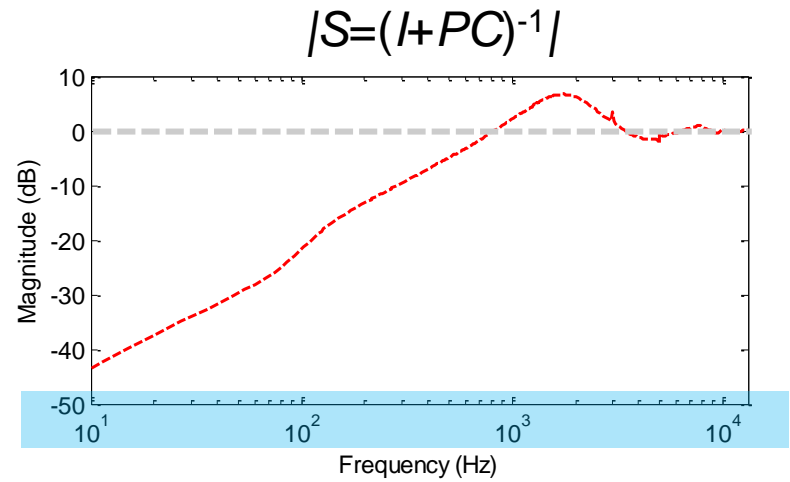

Bode's Integral

x-axis in linear scale

Typical feedback design

Bode's Integral

Theorem (basic Bode's Integral):
Let $S(s) = 1/(1 + L(s))$. If $L(s)$ and $S(s)$ are both rational and stable. Then

$$\frac{1}{\pi} \int_0^{\infty} \ln |S(j\omega)| d\omega = \frac{-1}{2} k_s$$

$$k_s = \lim_{s \rightarrow \infty} sL(s)$$

Bode's Integral

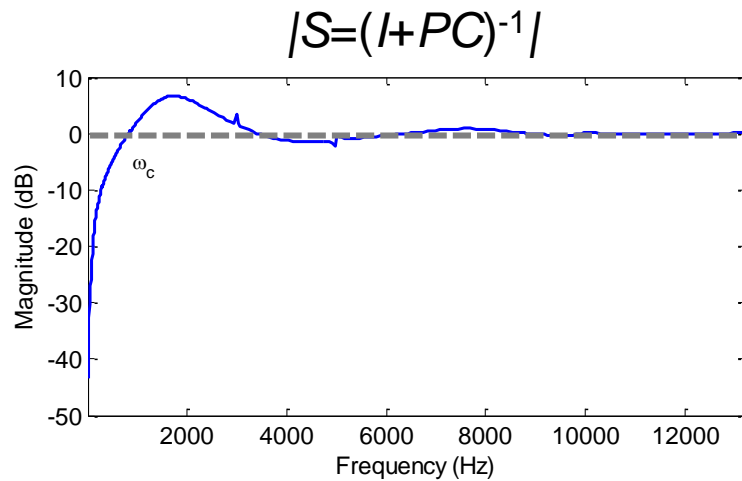

Theorem (basic Bode's Integral):
 Let $S(s) = 1/(1 + L(s))$. If $L(s)$ and $S(s)$ are both rational and stable. Then

$$\frac{1}{\pi} \int_0^{\infty} \ln |S(j\omega)| d\omega = \frac{-1}{2} k_s$$

$$k_s = \lim_{s \rightarrow \infty} sL(s)$$

Special case: If the relative degree of $L(s)$ larger than or equal to 2, then

$$\frac{1}{\pi} \int_0^{\infty} \ln |S(j\omega)| d\omega = 0$$

Bandwidth limitation

Recall:

Bode's Integral:

$$\frac{1}{\pi} \int_0^{\infty} \ln |S(j\omega)| d\omega = 0$$

Hence it is inevitable to have the error-amplification region.

Waterbed effect: pushing down **S** in one region causes amplification in some other region.

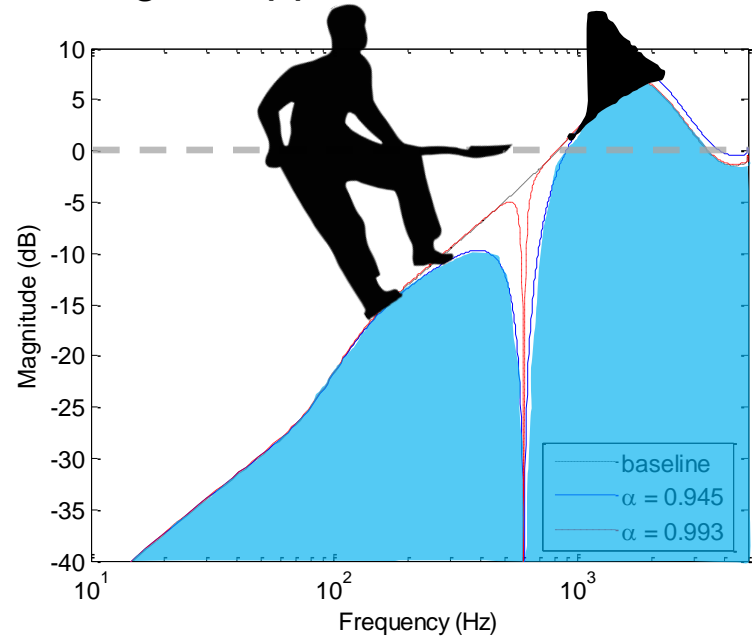

Waterbed Effect

So to achieve this,

Waterbed Effect

So to achieve this, this might happen...

General Bode's Integral

Theorem (general Bode's Integral): Let $S(s) = 1/(1 + L(s))$. If $S(s)$ is stable and $L(s)$ has unstable poles $\{p_k\}_{k=1}^q$. Then

$$\frac{1}{\pi} \int_0^\infty \ln |S(j\omega)| d\omega = \sum_{k=1}^q p_k$$

Proof: complex analysis, analytic functions, Cauchy Integral

#7

Limitations from unstable zeros

- Example: $P = sP_{else}$ \rightarrow constant inputs can't impact the output

#7

Limitations from unstable zeros

- Example: $P = sP_{else}$ → constant inputs can't impact the output
- More consequences:
 - S always has magnitudes larger than one

Limitations from unstable zeros

- Example: $P = sP_{else} \rightarrow$ constant inputs can't impact the output
- More consequences:
 - S always has magnitudes larger than one

Proof:

$$P(\sigma_o) = 0 \Rightarrow S(\sigma_o) = 1 / (1 + 0 \times C(\sigma_o)) = 1$$

Limitations from unstable zeros

- Example: $P = sP_{else} \rightarrow$ constant inputs can't impact the output
- More consequences:
 - S always has magnitudes larger than one

Proof:

$$P(\sigma_o) = 0 \Rightarrow S(\sigma_o) = 1 / (1 + 0 \times C(\sigma_o)) = 1$$

Closed-loop stability $\Rightarrow S(s)$ is analytic on the right-half complex plane

Limitations from unstable zeros

- Example: $P = sP_{else} \rightarrow$ constant inputs can't impact the output
- More consequences:
 - S always has magnitudes larger than one

Proof:

$$P(\sigma_o) = 0 \Rightarrow S(\sigma_o) = 1 / (1 + 0 \times C(\sigma_o)) = 1$$

Closed-loop stability $\Rightarrow S(s)$ is analytic on the right-half complex plane

Maximum modulus theorem \Rightarrow

$$S(j\omega) > 1 \text{ for some } \omega$$

Limitations from unstable zeros

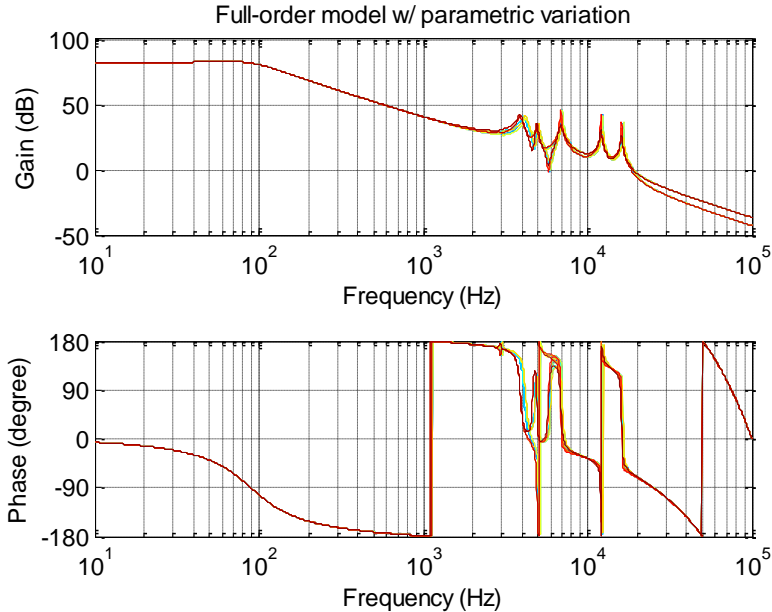

- Example: $P = sP_{else}$ → constant inputs can't impact the output
- More consequences:
 - S always has magnitudes larger than one
 - Not able to perform accurate system ID
 - High-gain instability
 - Step responses can have initial undershoot
 - etc

Resonance and anti-resonance

- Typical in mechanical systems.
- Usually identified experimentally.

HDD

Active suspension

Notch filters

Notch filtering: one common technique to handle resonances

Fundamental constraint in notch filtering: introduces phase delays to the system

Magnitude-phase relationship

Phase delays

Magnitude-phase relationship

Theorem (Bode's Phase Formula): If L is a minimum-phase transfer function, then

$$\angle L(j\omega) = \int_{-\infty}^{\infty} \frac{d \ln |L(e^{\nu}\omega)|}{d\nu} \psi(\nu) d\nu$$

where

$$\psi(\nu) = \frac{1}{\pi} \ln \frac{e^{|\nu|/2} + e^{-|\nu|/2}}{e^{|\nu|/2} - e^{-|\nu|/2}}$$

Magnitude-phase relationship

Theorem (Bode's Phase Formula): If L is a minimum-phase transfer function, then

$$\angle L(j\omega) = \int_{-\infty}^{\infty} \frac{d \ln |L(e^{\nu}\omega)|}{d\nu} \psi(\nu) d\nu$$

Slope of magnitude response

where

$$\psi(\nu) = \frac{1}{\pi} \ln \frac{e^{|\nu|/2} + e^{-|\nu|/2}}{e^{|\nu|/2} - e^{-|\nu|/2}}$$

Magnitude-phase relationship

Theorem (Bode's Phase Formula): If L is a minimum-phase transfer function, then

$$\angle L(j\omega) = \int_{-\infty}^{\infty} \frac{d \ln |L(e^{\nu}\omega)|}{d\nu} \psi(\nu) d\nu$$

Slope of magnitude response

where

$$\psi(\nu) = \frac{1}{\pi} \ln \frac{e^{|\nu|/2} + e^{-|\nu|/2}}{e^{|\nu|/2} - e^{-|\nu|/2}}$$

Approximately an impulse at 0

Magnitude-phase relationship

Theorem (Bode's Phase Formula): If L is a minimum-phase transfer function, then

$$\angle L(j\omega) = \int_{-\infty}^{\infty} \frac{d \ln |L(e^{\nu}\omega)|}{d\nu} \psi(\nu) d\nu$$

$$\psi(\nu) = \frac{1}{\pi} \ln \frac{e^{|\nu|/2} + e^{-|\nu|/2}}{e^{|\nu|/2} - e^{-|\nu|/2}}.$$

Discrete-time plant delay

$$y(k + 1) = f(u(k), u(k - 1), \dots)$$

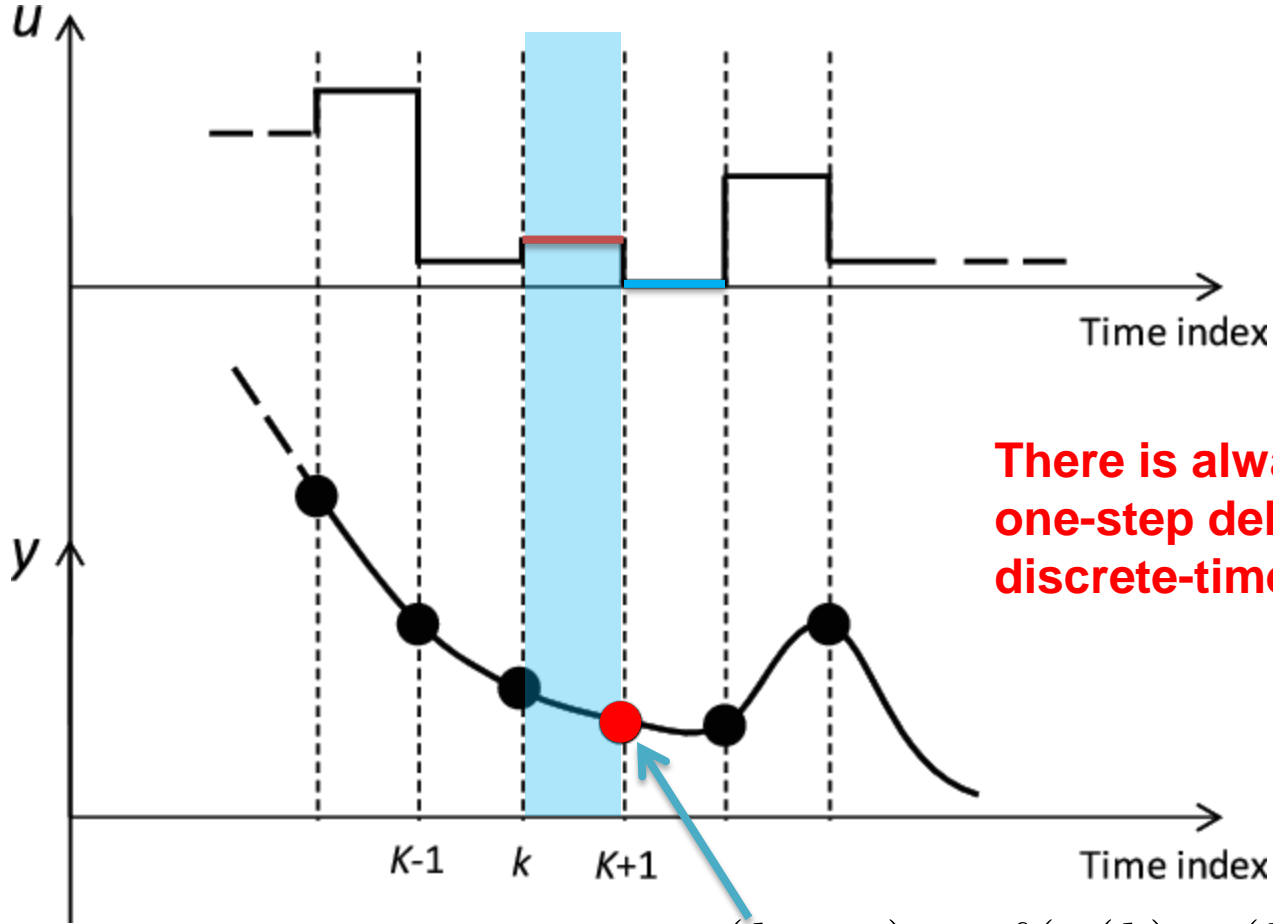

Discrete-time plant delay

$$y(k + 1) = f(u(k), u(k - 1), \dots)$$

$$y(k + 1) \neq f(u(k + 1), \dots)$$

Discrete-time plant delay

There is always at least one-step delay in discrete-time systems!

$$y(k + 1) = f(u(k), u(k - 1), \dots)$$
$$y(k + 1) \neq f(u(k + 1), \dots)$$

Estimate rise time from “bandwidth”

Estimate rise time from “bandwidth”

Estimate rise time from “bandwidth”

Estimate “bandwidth” from rise time

$t_r \approx 20 \text{ sec}$

Estimate “bandwidth” from rise time

Estimate “bandwidth” from rise time

#10 Bandwidth and rise time: practical application

Step response of a high-order closed-loop system

#10 Bandwidth and rise time: practical application

Step response of a high-order closed-loop system

$$\text{Bandwidth} \approx \frac{2}{0.25 \times 10^{-3} \times 2\pi} = 1273 \text{ Hz}$$

#10 Bandwidth and rise time: practical application

Actual system frequency response

Step response of a high-order closed-loop system

$$\text{Bandwidth} \approx \frac{2}{0.25 \times 10^{-3} \times 2\pi} = 1273 \text{ Hz}$$

Sampling-time selection

- Rule of thumb:
 - Sampling frequency $\approx 10 \sim 20$ bandwidth (in Hz)

Sampling-time selection

- Rule of thumb:

- Sampling frequency $\approx 10 \sim 20$ bandwidth (in Hz)

4~6 samples during rise time in step response

Sampling-time selection

Intuition: 20 = the number of letters in “sampling frequencies”

- Rule of thumb:

- Sampling frequency \approx 10 ~ 20 bandwidth (in Hz)

4~6 samples during rise time in step response

#11 Sampling-time selection: example

Example:

$$P = k$$

$$C = \frac{\omega_n^2}{s^2 + 2\xi\omega_n s} \frac{1}{k}$$

$$S = \frac{1}{1 + PC} = \frac{s^2 + 2\xi\omega_n s}{s^2 + 2\xi\omega_n s + \omega_n^2}$$
$$T = 1 - S = \frac{\omega_n^2}{s^2 + 2\xi\omega_n s + \omega_n^2}$$

#11 Sampling-time selection: example

Sampling frequency = 6 x bandwidth

#11 Sampling-time selection: example

Sampling frequency = 10 x bandwidth

#11 Sampling-time selection: example

Sampling frequency = 20 x bandwidth

#11 Sampling-time selection: example

Sampling frequency = 40 x bandwidth
